Rhetorical Ecology Engineering Building II

The Engineering Building II is a large open room with tons of tables large enough to fit 10 and computers cluttered together in the middle. The room is loud as people converse their assignments. The room's primary purpose is a lobby to pass through to navigate to classrooms in the back of the building, but the inside the lobby, it promotes group focus, studying and networking. The space is used as a walk way, but also a study hub for students who share classes in the building, and seeing that it is indoors, the room doesn't encourage physical activities or people who are not there to accomplish something of importance. The lobby uses metal pipage to reflect the engineering themes of the building as well as it's continued use of colors of metal and brick. The lobby has a display of rockets and an old Disney rollercoaster cart. The room feels large and open, it lets in much sunlight to illuminate the room, and then disguises it's pillars as some kind of sparks as, what could be argued, trees. The room feels designed to make you feel in nature and the transition when entering the room reflects this as if it wants you to know you've left biological nature behind and are entering the world of artificial nature, an engineered one.

The rhetors of the space are the engineers and architects UCF hired to build the Engineering Building II. The building had to be constructed to appeal to its audience: students and professors. The entire building was likely constructed to allow for more classrooms dedicated to engineering courses, but the lobby was also designed to act as a hub for engineering students and clubs to gather, to network and accomplish their goals together. The layout is designed to make sure through traffic to classrooms in the back are easily accessible while making sure the many tables and computers in the center of the room remain inviting, as if they will always wait for you when you do find yourself needing them. The décor also acts as a reminder of what the building has to offer: not only engineering, but stellar performance as they display the accomplishments that have happened through the building.

The lobby does an excellent job making sure it is inviting to take a seat and get work done, but only when it isn't at capacity. When I went to take the pictures, every table was consumed by a large group of people conversing over some assignment or project. When the only open seats are one here and one there that would force you take part in the task active between the members at the table, it makes individual work feel uninvited. Other times I have gone where there are less people, where tables are open, individual work feels welcome.

While the building always fills its visitors with awe due to its grand scale, how inviting it's lobby is take a seat and study for a while depends on the circumstances. Doug Downs describes this as the rhetorical appeal "kairos", in which "translates to something like 'timely good fortune' or simply 'lucky timing' Kairos is the principle that rhetors have for from complete control of their tests and discourses , because circumstances beyond their control can intervene to change the moment and what it makes sense to say in that moment." It doesn't matter how inviting the lobby is designed to feel, whenever it is too crowed or is booked by a club for an event, some people will always feel unwelcome.
